

# *Observational Programme in Kent*

- *ASTRO-F, WFCAM, SCUBA-2, SALT*
- *UKIRT: individual protostellar outflows*
- *SAO/MMT/LBT: individual high- mass protostars*
- *NTT/Calar Alto + SEST: rho Ophiuchus*
- *2MASS/NTT: Rosette Giant Molecular Complex*

# *Star Formation Panoramas*

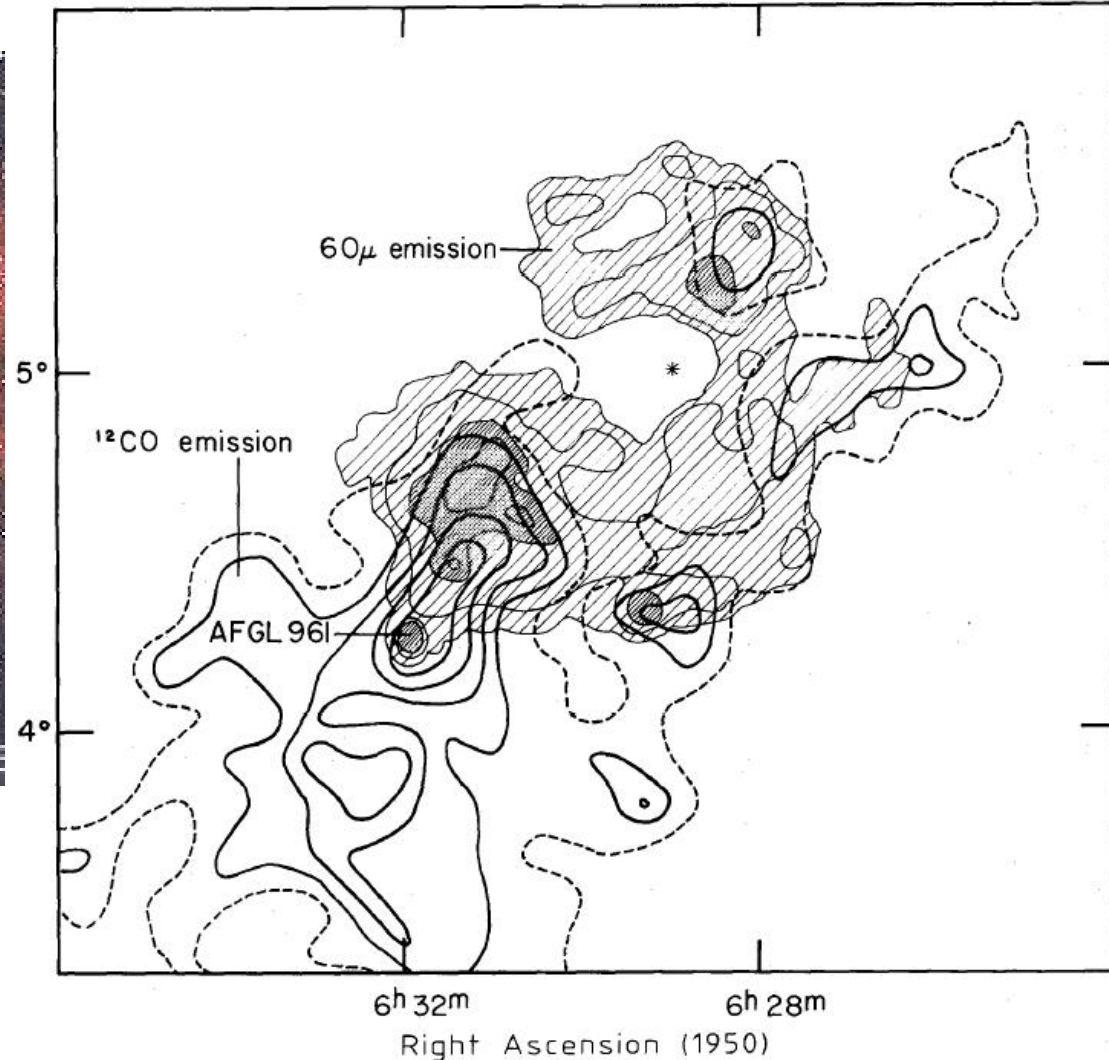

- *Functions*
- *Fractions*
- *Frequencies*
- *...insight into the Processes*
  - *Roland Gredel (Heidelberg)*
  - *Tigran Khanzadyan (Porto)*
  - *Jinzeng Li (Beijing)*
  - *Thomas Stanke (Hawaii)*
  - *Chris Davis (Hawaii)*
- *Embedded in clouds*
- *Clouds are extended*

# *Modes and seeds of star formation*

- Spontaneous contractions
- Turbulent-induced collapse
- Radiation Driven Implosions
- External trigger
- Sequential internal triggers
- Shock-swept fragmenting shell

# *The Rosette Nebula and Complex*

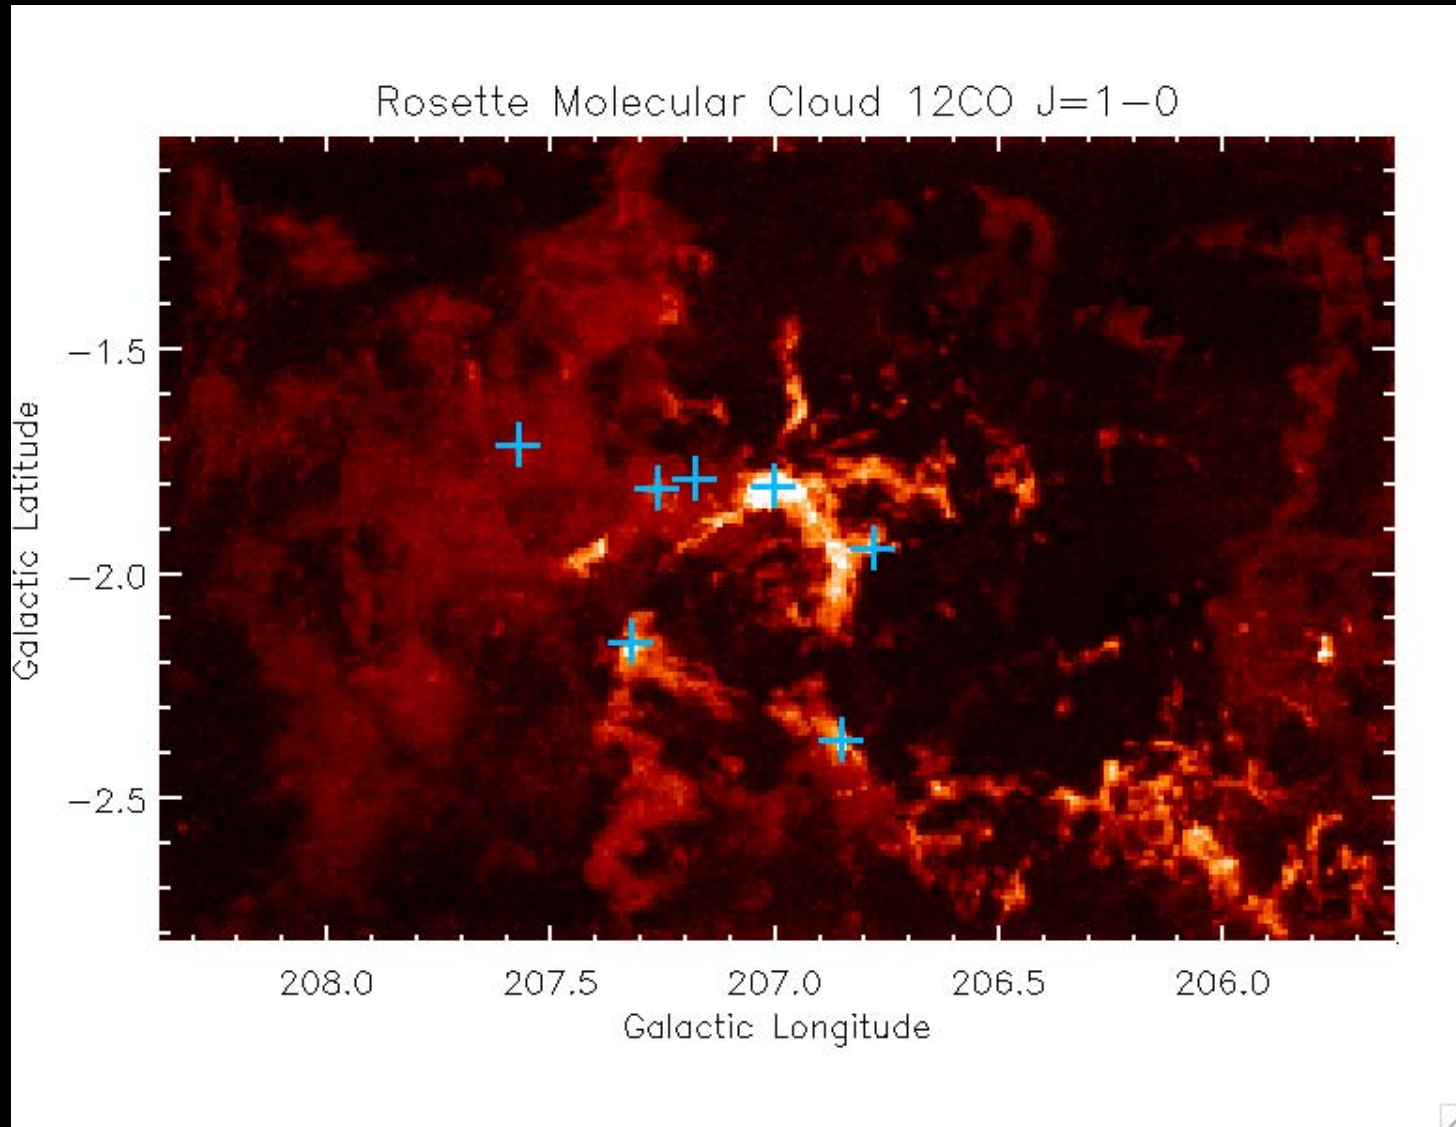

- H II region
- Distant: 1.4 kpc
- Size 30pc

**Cox et al 1990**

*CO filaments*      *J. Williams et al IAU 227*

*K-band clusters: Phelps and Lada*

# The Rosette Complex: 2MASS, H-Ks colour

**H-Ks < 0.2**

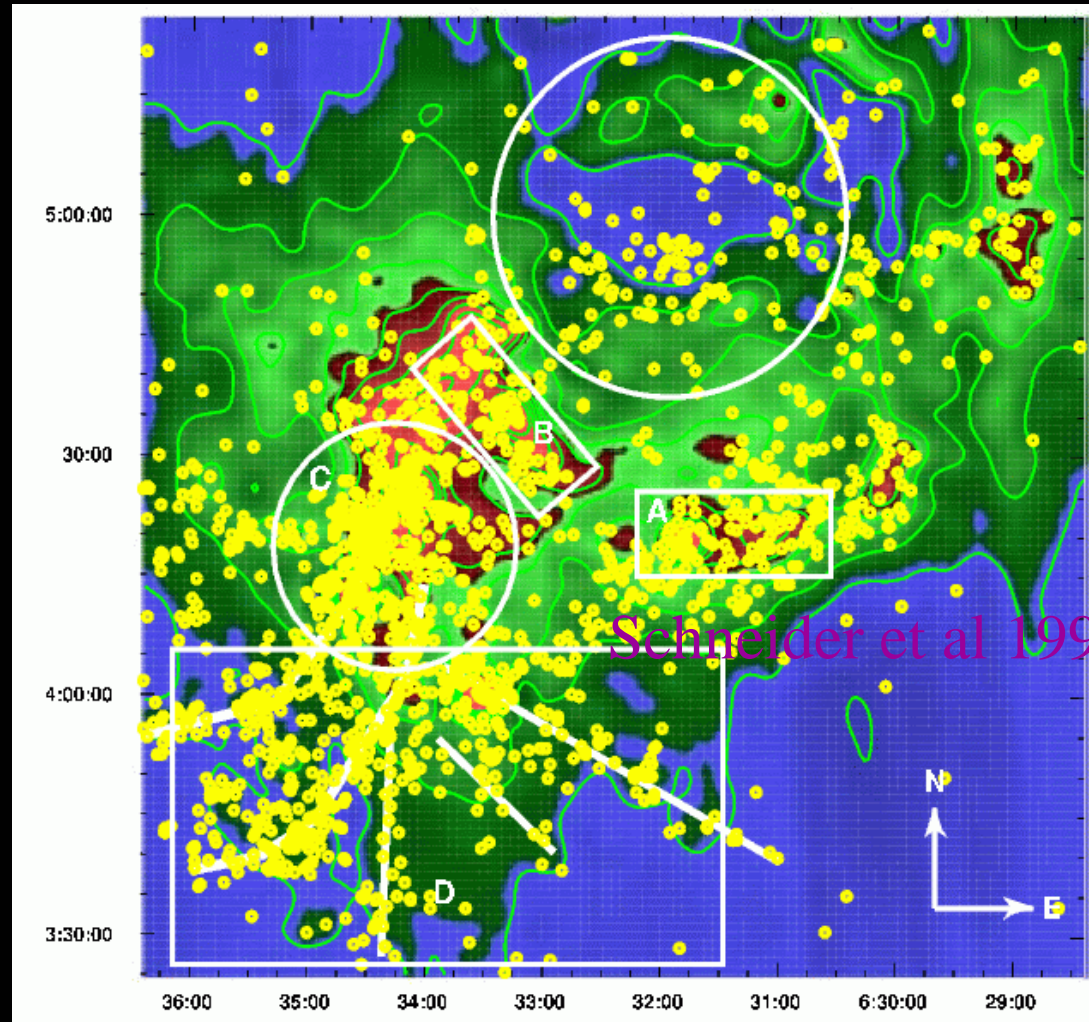

**H-Ks > 1.0**

# *The Rosette Seeds* Jinzeng Li & Smith

H-Ks > 0.5

- 2MASS: JHK analysis:
- colour-colour
- colour-magnitude
- KLF
- clustering
  
- Widespread clustering
- High-mass star formation
- Identify 4 Regions:
- A & B: `baked' shell
- C: AFGL 961E
- D: The Rosette Tree?

# *Evolution of the RMC*

*(Jinzeng Li & Smith)*

- Ionisation front; originating from NGC2244
- Ultraviolet leaks through
- Radiation Driven Implosions
- NO: need local SF - no correlation/connection
- .....OR .....

# *Evolution of the RMC*

*(Jinzeng Li & Smith)*

- Sequential, originating from from NGC2244
- A TREE
- Spontaneous in AFGL 961 cluster, spreads along branches
- NO: AFGL 961 is the youngest
- .....OR .....

# *Evolution of the RMC*

*(Jinzeng Li & Smith)*

- Triggered, compressed shells from NGC2244
- PLUS, a large-scale cloud collapse: gravo-turbulent collapse

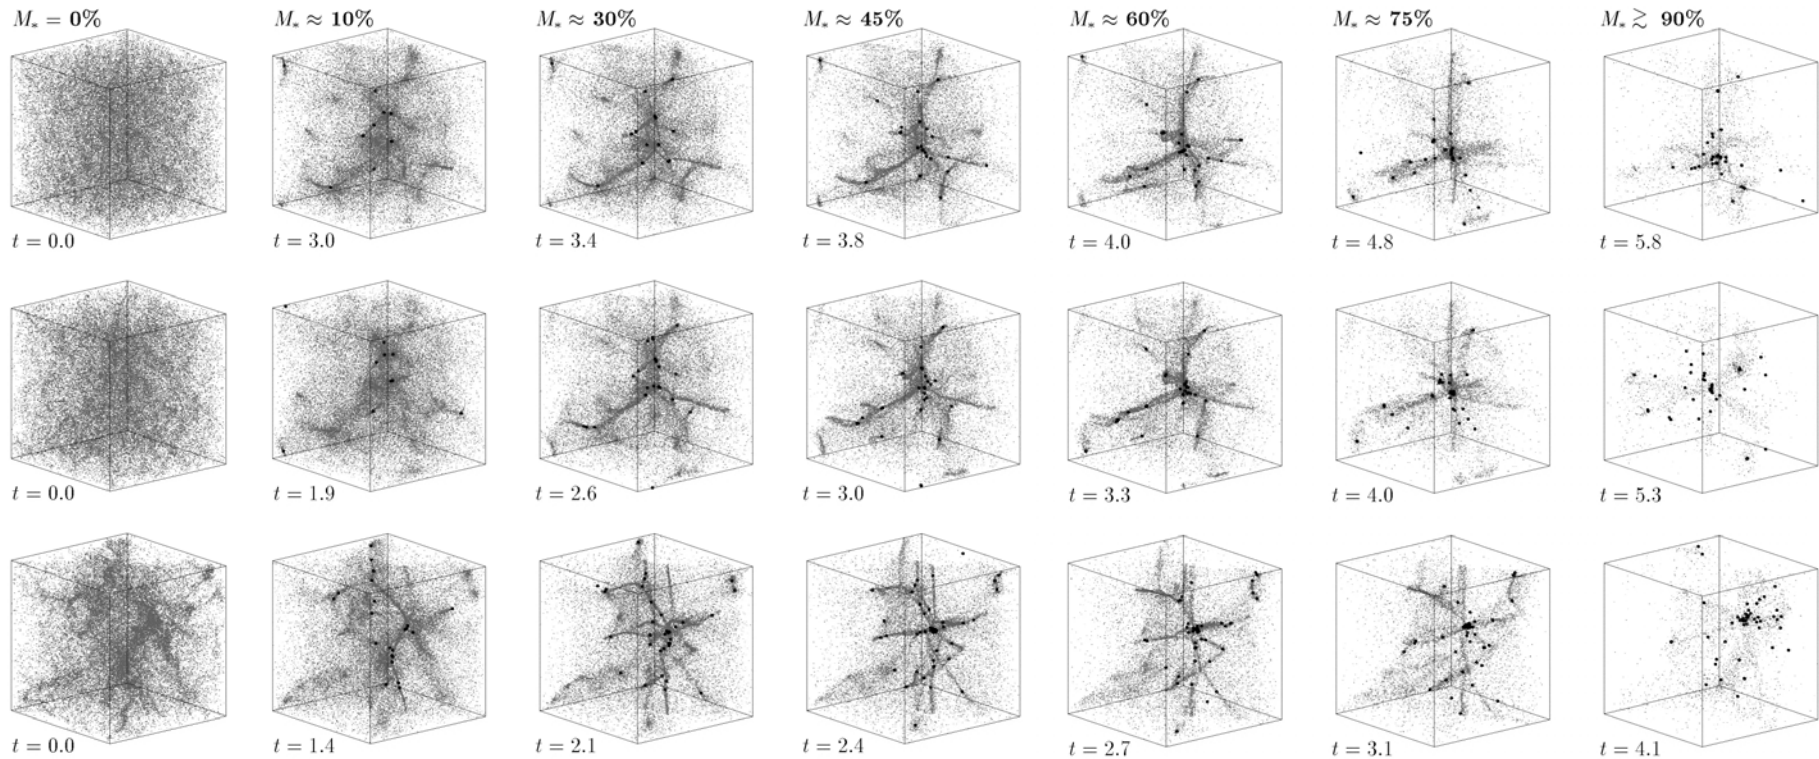

- Externally driven turbulence.
- Flow along sheets, into filaments
- Region C sub-clusters: intersection points
- Simulation with gravity: Smith et al 2000
- (Model D2 of Klessen et al 2000).

# Gravoturbulent simulations

(Klessen & Burkert 2000)

- SPH code, 222 Jeans masses, isothermal

# *rho Ophiuchus: a nearby star-forming cloud*

**Millimetre: bright dust cores**  
**(Visible: dark patches)**

**ESO SEST 1.2mm:  $1^\circ \times 1.2^\circ$**

**Young stars:  $10^6$  yr**

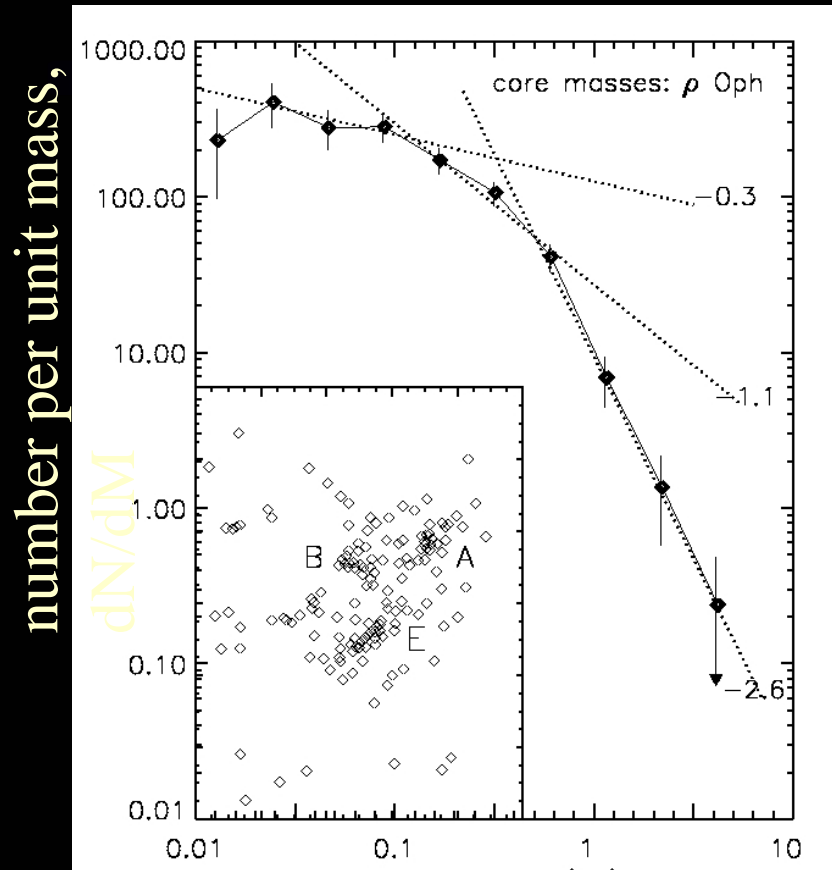

**Cores:  $10^6$  yr**

**A few protostars:  $10^4$  yr**

**Clouds are young: ephemeral**

# Distribution in mass

Log (core mass)

# Distribution in space

Log (separation in AU)

cores

# *rho Ophiuchus: JHK photometry*

# *Prospects*

- To *\*find\** the protostars in NIR: need wide-field H<sub>2</sub> surveys
- To find YSOs in NIR: need JHK surveys.
- SPITZER - IRAC: Class I/Class II
- ASTRO-F + Herschel: Class 0 protostars

**H<sub>2</sub> surveys: thrust from launcher + resistance from environment**

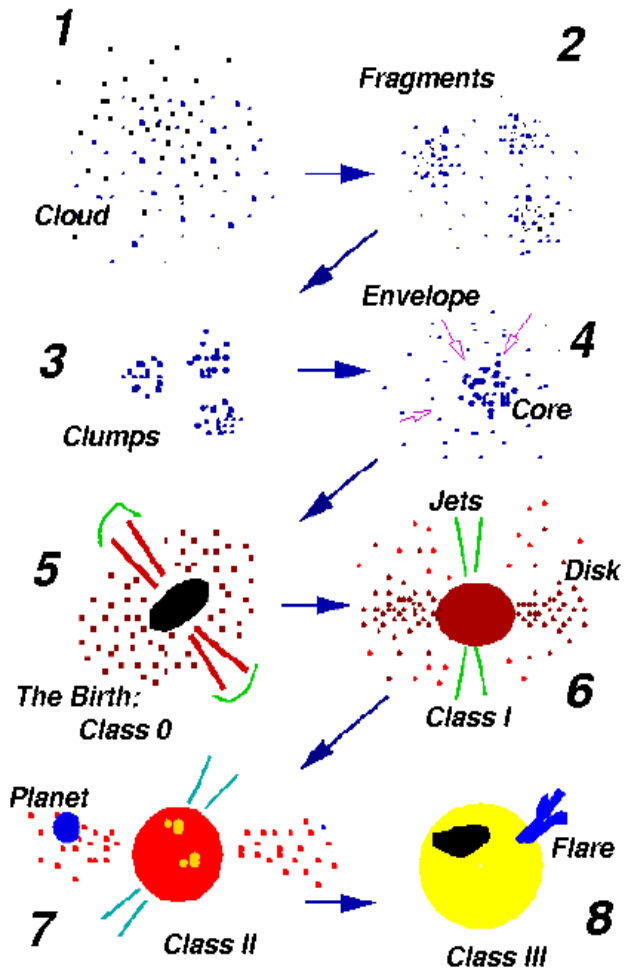

*To be continued...*

The End.

Thank you for your attention.

# *The Revolution*

1. Rapid conception
2. Holy grail
3. Inflow - outflow enigma
4. Massive stars
5. Planets, brown dwarves
6. Starbursts
7. Primordial stars

# *Massive star formation: The Big Issues*

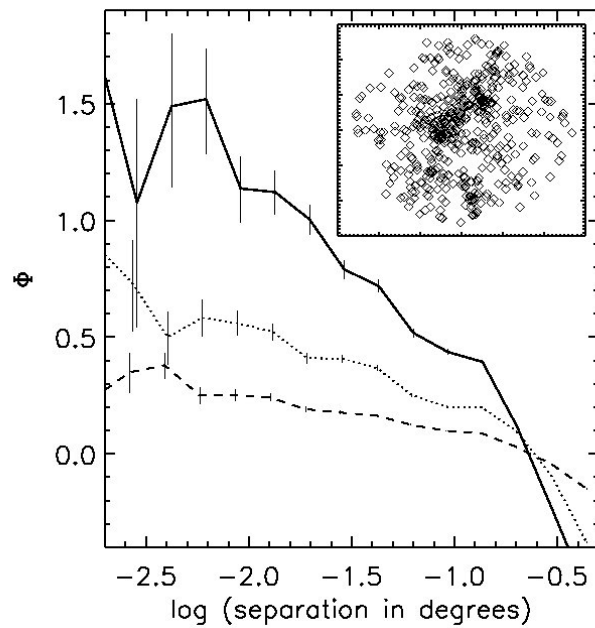

- Fragmentation of Giant Clouds
- Gas to Stars: accretion or mergers?
- Cores to Clusters; efficiency, IMF
- Modes: Spontaneous, Triggered, Sequential,.....
- Relaxation: dynamics, dispersion of stars
- History: Galactic scales: extrapolate?
- Physics: shocks, turbulence, magnetic field, radiation, gravity

**Turbulence, Gravity, Feedback,  
Regulation, Interaction,  
Triggering: COMPLEX SYSTEM**

# *The Rosette Complex*

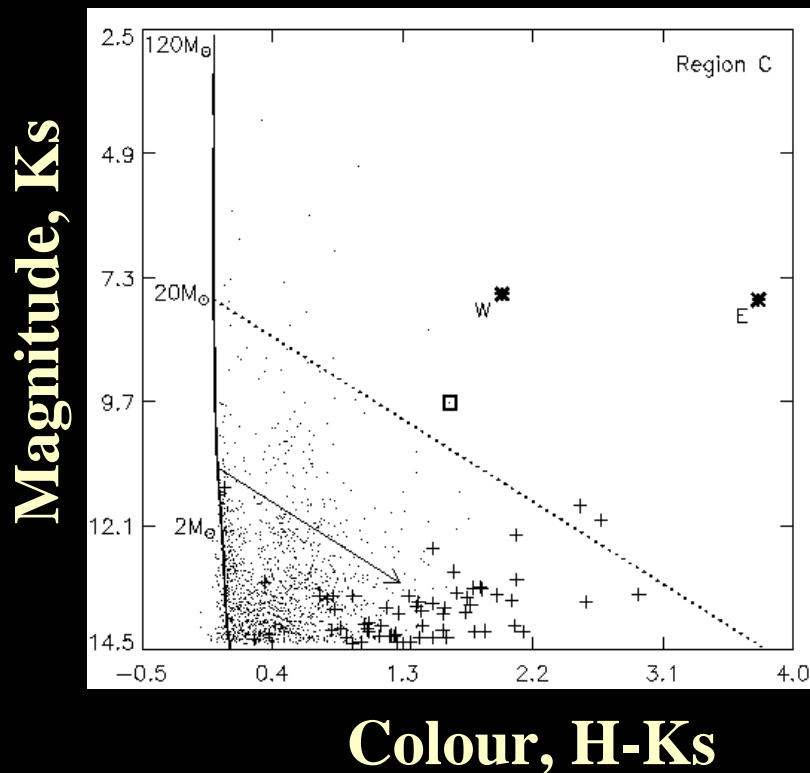

**Spatial  
distributions:  
Two-point  
correlation function**

# AFGL 961

Infrared

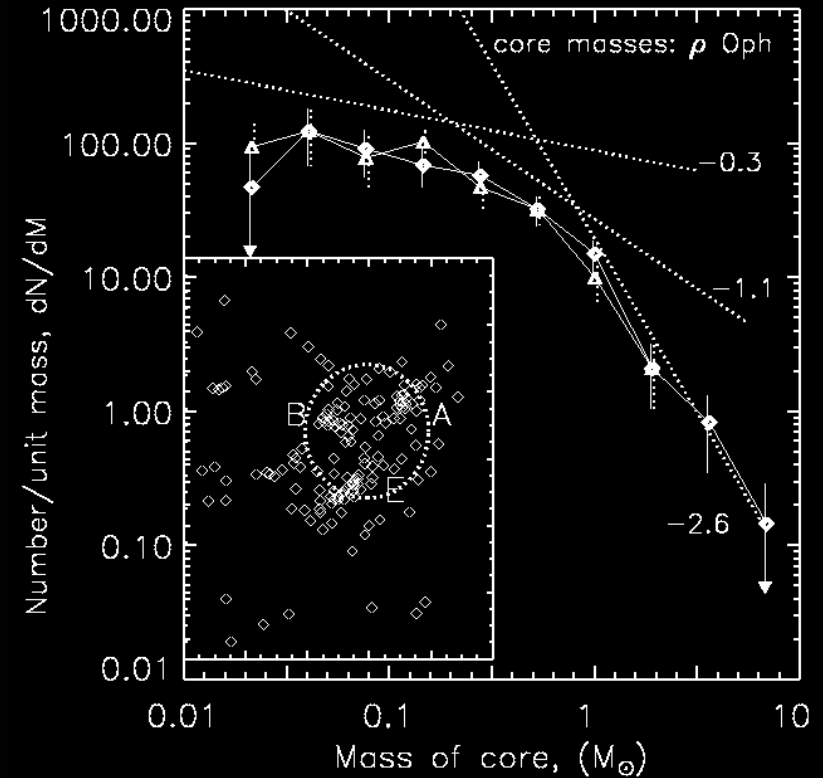

- JHK images: details in 5' region
- Colour-Magnitude diagram
- **Most massive star:  $130 M_{\text{sun}}$  !!!!**
- Triple system? All 3: IR excesses
- Cavity: stars visible in cavity.

Optical

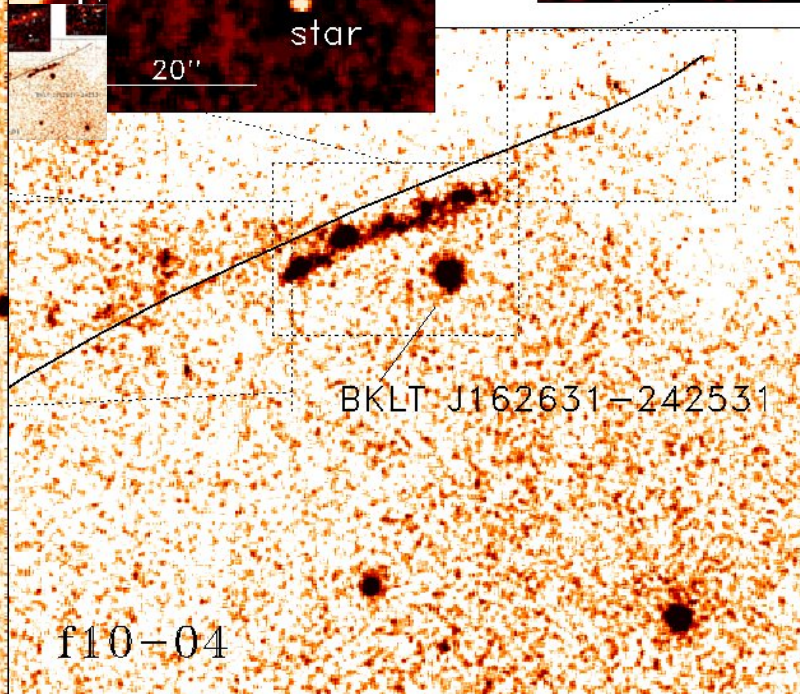

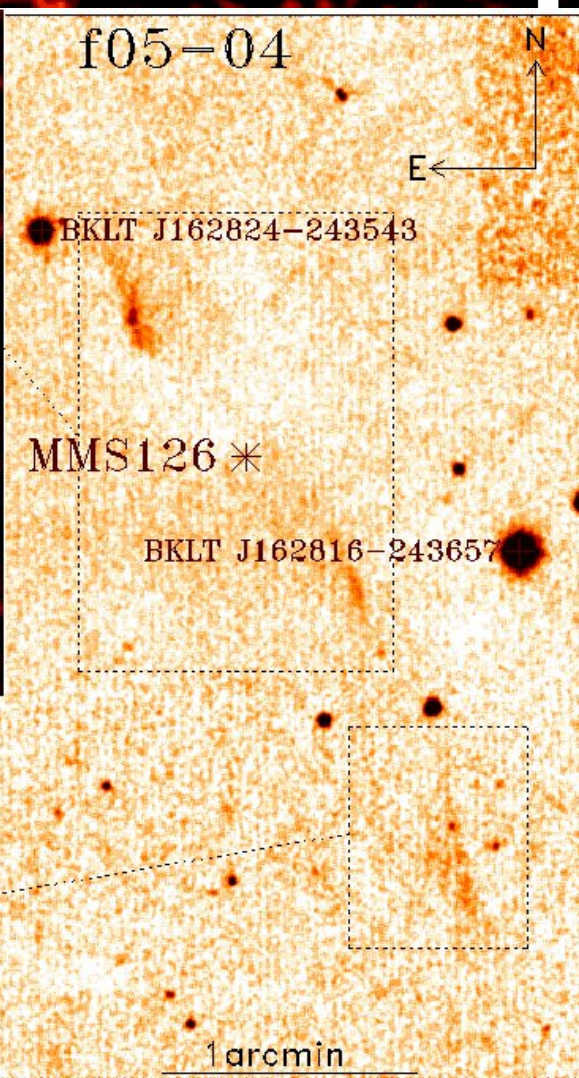

# What controls star formation?

## 12 outflows

Clustered,  
Masses

# Evolution of protostars

## Colour-Colour diagrams

- 2MASS
